REASONS FOR ALLOWANCE

The following is an examiner's statement of reasons for allowance:

The prior art, either alone or in combination, does not disclose or render obvious a variable optical attenuator including 1st and 2nd collimator retaining input fibers and an attenuating means having two anamorphic prisms for respectively expanding and shrinking parallel light beam and an optical baffle positioned between the two anamorphic prisms; wherein, the parallel light beam from the first collimator passes through one anamorphic prism, then expands to form an expanding light beam, the optical baffle is moveable to block part of the expanding light beam, and another part of the expanding light beam is shrunk by the other anamorphic prism, then is received by the second collimator and outputs from the output fiber in combination with the rest of claim 1.

The prior art, either alone or in combination, does not disclose or render obvious a variable optical attenuator including a first collimator; a second collimator; a first anamorphic prism, a second anamorphic prism, a third anamorphic prism and a forth anamorphic prism orderly positioning in parallel light beam from first collimator; and an optical baffle for blocking part of the light beam; where in parallel light beams coming from the first collimator pass through the first and the second anamorphic prisms, then expand to form an expanded light beams, the optical baffle is moveable to block a part of the expanded light beams, the remaining part of the expanded light beams are shrunk by the third and forth anamorphic prisms, then are received by the second collimator in combination with the rest of claim 5.

The prior art, either alone or in combination, does not disclose or render obvious a variable optical attenuator including 1st and 2nd collimator retaining input fibers and an attenuating means having an expanding device for expanding parallel light beam from the first collimator and an optical baffle for blocking part of the light beam; wherein, parallel light beam from the first collimator passes through the expanding device, then expands to form an expanding light beam, the optical baffle is adjustably moveable to block part of the expanded light beam, and thus another part of the expanded light beam is adapted to be received by the second collimator and outputs from the output fiber in combination with the rest of claim 10.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
